Abstract

Entrepreneurship Spirit to diffusing of entrepreneurship mindset and skill sets among faculty, students and campus fraternity. Hence why it is fostering an ecosystem that enables risk taking, engineering and innovation as well as enterprise. So the elements of an entrepreneurial ecosystem at the university system are funds, mentorships, programs and breeding grounds for such innovation. In the process, universities will develop enterprising leaders who can start new firms and begin innovation more generally in every industry. The paper also points to the fact that student entrepreneurship socialises creativity, innovation and applied learning within the university system. Chi-square Test Analysis this suggests that the skill of innovative and entrepreneurship for an alternative evidence capacity with different enterprise opportunity account are confirms in student profile.

Keywords: Entrepreneurial Spirit, Innovation Capability, Chi-square test, Entrepreneurship Eco-system.

1. Introduction

The Scientific Spirit Has a Role of Entrepreneurial Spirit in Education An entrepreneur must be the person who gets into his/her idea or problems, develops skills through climate culture driven environment which helps to spread creativity, invention and entrepreneur spirit. And it means making students learn the skills and mind-set to recognize opportunity, accept calculated risk and commercialize innovation in the outside world. Here are the few major elements which imbued the culture of entrepreneurship in university system.

Entrepreneurial education: Schools could begin more tailored programs and workshops focused on entrepreneurship, to provide students with the tools they need to start their businesses. These programs tend to focus on things like identifying opportunities, business strategy, marketing, finance and leadership.

Incubation and Acceleration: Colleges and universities have the opportunity to build incubation and acceleration structures that are equipped to develop the next generation of innovators through resources, support and mentorship. These programs offer students and graduates space, introductions, money and professional coaching to turn their ideas into real companies.

Electronic copy available at: https://ssrn.com/abstract=5103507

Collaborative partnership: To ensure that the full potential of the institution is realised, they must approach business, government and society and create an institutional environment that encourages partnership. Strong networks can aid in information sharing, access to funding, research collaboration, internships and mentorship all crucial for entrepreneurship to thrive and universities could be the enabler.

Networking and Events: Organizers for entrepreneurship-related events including lectures and workshops, competitions, and networking sessions that unite students, alumni, entrepreneurs, and investors. Meetings like this are gold when it comes to education, idea exchange and networking!

Seed Funds, Grants and Scholarship: Universities can create seed funds, grants, and scholarships to nurture entrepreneurial ventures or to encourage students to pursue their company ideas. Actually, at the early stage investment and other money do lower the entry bar and help many future business owners to become a part of their ideas.

Mindset and Culture: Instilling the above attributes (of entrepreneurship) in the students on campus is critical. An atmosphere that encourages and fosters risk-taking among teachers and students, an environment of creativity and experimentation that is the breeding ground for innovation.

Alumni Engagement: Successful graduates are not only examples for students who may or more likely will not pursue entrepreneurship, they help continue the conversation. Universities could develop mentorship programs, hold alumni networking events and bring in speakers to provide students a sense of experienced business owners who can contribute advice and assistance.

2. Literature Review

University innovation competency refers to the capability of any educational institution in creating a stimulating environment for creativity, problem-solving and enterprise among students as well as faculty members and employees. It denotes the transportation of skillsets, knowledge-base & attitudes for developing hypothesis-driven solutions that create unified value a.k.a., all these products, services and processes we deploy to enable new customer valuable benefits. Academy of Management Learning and Education Citations. This paper is a broad & systematic literature scan report on role of Universities in Entrepreneurship, based on existing writings (the literature), scholarly articles/books and literary works up to October 2023. They encompass the outcome measures from entrepreneurship education [3, 4], university industry sector partnerships [5], mechanisms facilitating student entrepreneurs [6] and institutional drivers of the entrepreneurial engagement of universities (Gonzalez-Alvarez et al.)

The previous research had adopted a multi-level perspective examining individual attributes, the institutional environment and learning support systems as determinants of EI [9]. However, other literature has neglected the fact that not all universities are the same in terms of the spectrum of university entrepreneurship activities that they can or cannot do and the outcomes.

According to the perception of each other's user experience, to enhance the quality of college by building a scientific and technological ecosystem for college innovation and entrepreneurship education [11]. At the same time, also fulfilling green and low energy

Electronic copy available at: https://ssrn.com/abstract=5103507

hardware/software design systems. The result of experiment indicated that the system is able to provide a high data throughput performance, a very large fault tolerance and low energy consumption performance for entire system based on educational ecosystem constructed in this research.

This paper is to comb and summarize the domestic and foreign literature about the cultivation of innovation & entrepreneurship ecosystem, make clear that the work of innovation & entrepreneurship can better contribute to promote college students independent entrepreneurship, driving on an interactive working relationship between campus innovation & entrepreneurship system and campus Entrepreneurship education system. The application of big data and new data technology to campus entrepreneurship education system helps creative entrepreneurial education ecosystem act, hence we proposed the requirements of innovative entrepreneurial education ecosystem act: university entrepreneurship training transforming towards high efficiency.

The findings triangulate as a missing piece in the folk understanding of university system level start up ecosystem dynamics, and suggest implications for future research on this space where relevant, as well as practice. All universities have to reorient themselves towards predicting the challenge of innovation and entrepreneurial skills at a very inception stage, i.e., graduating students.

3. Entrepreneurship in University System

Student entrepreneurship is defined as a student taking initiative to start and/or run their own companies or ventures while pursuing classes (usually higher education).

The concept echoed well since peer institutes and the university were definitely aware of what student start-up goals mean (and the ecosystem around entrepreneurship). Figure 1 shows the Entrepreneurship education and academic Performance.

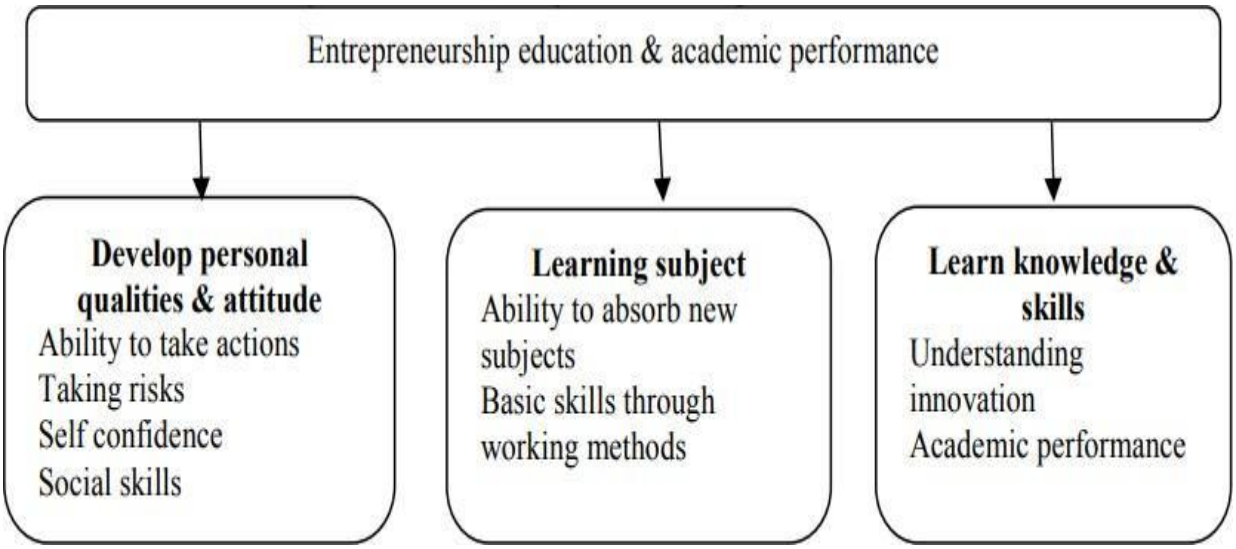

Figure 1. Entrepreneurship education and academic Performance

Electronic copy available at: https://ssrn.com/abstract=5103507

Here are the key nuggets on what delivering great entrepreneurship education should look like:

- Business Ecosystem
- Subjects and Categories:
- Help from Incubators, and Accelerators
- Investments
- Networking Opportunities
- Extra-Curricular
- Academic vs. Entrepreneurial Balance

Specifically, university-based student entrepreneurship reinforces innovation, fosters creativity through practice [7]. It exposes students to critical networks, opportunities and skills that will enable them to succeed in whatever career path they choose—and entrepreneurship—is the future. The current study utilizes the following definition of entrepreneurship education and academic success: 'The domain of entrepreneurship education develops the students' ability to be proactive, be receptive to new academic areas, and practice market-focused, experiential learning, which leads to high academic success.

4. Data Analysis

This study is descriptive cum analytical research design and based on literature review. Models of entrepreneurial success were collated by literature survey. For the analysis in this study, simple statistical techniques of analysis as frequency distribution, table and percentage. This recent agenda on entrepreneurship success based on conducting analysis on the factors used in the reviewed models at the perspective of an individual student.

Do you have a specific crawl, walk run deliverable that you want your business to aim for? Interpretation 47.1% of business respondents have no idea or vision to finish their dreams through your business supporting them to finish their dream with the help of your own company. Rest all have no idea.

Table No.1: Are you comfortable in taking risk?

Responses	Frequency	Percent
No	10	9.8
Yes	92	90.2
Total	102	100.0

Electronic copy available at: https://ssrn.com/abstract=5103507

Interpretation: From the above table 1 we can observe that nearly 90% of responders have a positive response towards risk in Entrepreneurship.

Table 2. Do you have a passion, skills and time to manage task effectively?

Questions	Responses	Frequency	Percent
Do you have a passion for what you do?	No	7	6.9
	Yes	95	93.1
	Total	102	100
Do you have strong communication skills?	No	47	46.1
	Yes	55	53.9
	Total	102	100.0
Are you able to manage your time and prioritize tasks effectively?	No	20	19.6
	Yes	82	80.4
	Total	102	100.0

Interpretation: Above frequency table 2 clearly indicates only 7% respondents hates what they are doing,92.86% people loves what they do and around half loves to do their work this is because it gives them happiness and pleasure. 54% articulate, shares notions sentiments ideas. Entrepreneurs play such kind of critical role for the success not just for business but also for whole larger economy and near about 80%of respondent agree that they prioritize the work which is really matters according to them from time management perspective.

Hypothesis- I

Secondly, the article is trained on data until October 2023the following hypothesis have been developed based to test.

H1: Students Powered by Passion for Entrepreneurship

The table 3 below shows the Chi-square test data

Table 3. a): Chi-square test data

	Do you have a passion for? what you do?		Total
	No	Yes	
No	5	21	26
Are you a self-starter?			
Yes	2	74	76
Total	7	95	102

Electronic copy available at: https://ssrn.com/abstract=5103507

Table 3. b). Chi-square test data

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	8.351[a]	1	0.004
Continuity Correction	5.956	1	0.015
Like lihood Ratio	7.061	1	0.008
N of Valid Cases	102		

Interpretation: The graduates really have to prove the passion of entrepreneurs. A Chi-square test was run in SPSS with a 95% confidence level and a 5% significance level. Cross table frequency in descriptive form. It can be seen from frequency that 74 respondents out of 95 respondents told they are self-starter and are passionate for entrepreneurship. Chi-square result display show that significant value i.e. 0.004 which is far less than 0.05. Thus, fail to reject null hypotheses and so accept alternative hypothesis.

Hypothesis II

H0: Student initiative for entrepreneurship is not related to his/ her ability towards opportunity discovery and exploitation.

H2: Students initiative for Entrepreneurship Student initiative for entrepreneurship is rely on students can identify and leverage entrepreneurial opportunity.

Table 4. a): Are you able to identify and capitalize on market opportunities.

		Able to Identify and Capitalize on Market Opportunities?		Total
		No	Yes	
Have you ever participated in an entrepreneurial activity, such as starting a business or developing a product/service?	No	35	24	59
	Yes	12	31	43
Total		47	55	102

Electronic copy available at: https://ssrn.com/abstract=5103507

Table 4. b): Chi-square test data

	Value	df	Asymptotic Significance (2-sided)
Pearson Chi-Square	9.880[a]	1	0.002
Continuity Correction	8.656	1	0.003
Likelihood Ratio	10.127	1	0.001
Number of Valid Cases	102		

Interpretation: From the above table 4 it depicts that there is a total of 102 students where 55 students have engaged in an entrepreneurial activity that is to setup of a business or to create a good & service and can recognise and invest the entrepreurial opportunities exist in the market. Chi-square test was performed to check the association between these two factors. We obtained a significance value of 0.002 which was less than our alpha value of 0.05. Hence, it is really favourable to the alternative hypothesis. Thus, proved that "Students ability to identification and harnessing entrepreneurial opportunity is dependent on student's initiative for entrepreneurship".

5. Findings

The following are the deductions made based on data analytics.

1) From the literature study, it can be seen that there may have been several entrepreneurial courses, activities and cells provided to them by the universities and educational institutes for their entrepreneurship development.
2) The research in innovation area also pointed out the absence of incubation centres across universities and educational institutes to offer exposure, an appropriate ecosystem through a mandate and healthy support ecosystem as well as infrastructure for presently aspiring entrepreneurs (Studying India)
3) They are expected to build an environment of co-creation that leads to collaboration with multiple entities such as industry and government, and communities. It will enable exchange of knowledge, internship, mentorship and research opportunities.
4) The paper is based on a literature review which says that three factors will be important as Social, Financial and Human Capital have a very important role in promoting and also enkindling the spirit of entrepreneurship among the institutes.
5) The data analysis showed that the self-motivation of students is the critical factor which decides their entrepreneurial passion.
6) Market provides immense opportunities for the entrepreneurs but it is the students efforts which helps him to discover and exploit the market opportunities.
7) It is in such control hands on institutes level to develop or enhance the Entrepreneurial Competence required to have the abilities of understanding market opportunities.

Electronic copy available at: https://ssrn.com/abstract=5103507

8) According to CII report, discover that high passion surfing is done by maximum young aspirant of entrepreneurship and examine with high risk-taking appetite.
9) Relationship skills do well too as almost half of all the respondents struggle on this.

6. Conclusion

In the context of entrepreneurship education in university, this paper discusses innovation, creativity and practical learning for student entrepreneurship. The survey shows that young generation is mapping there way to entrepreneur but they are ignoring the long run vision and thought about their success. So, you need to have appropriate instructions during this phase. Half of those surveyed lack in communication competency. Hence, this is the stage where the proper communication skills need to be developed. The young achievers have planned their time really well and they know how to make the best use of the time. If the results from the hypothesis are unable to reject the null hypothesis, therefore we concluded that self-motivated students have fire in their belly for innovation and entrepreneurship. The conclusion at the end of this study was also that identification of entrepreneurial opportunity and exploitation depend entirely on student activeness in the innovation and entrepreneurship process.
